Like most CAD software, AutoCAD is used to design and draft drawings, drawings for use in manufacturing, and models, which can then be exported in many formats and published in a variety of graphics publications such as printed publications, CD-ROMs, the internet, and so on. AutoCAD is an enterprise solution and, therefore, is available as an on-premise solution or as a cloud solution. For cloud-based solutions, a vendor licenses the application and maintains it. To run AutoCAD from an internet-based solution, a CAD operator (user) has access to the cloud-based service through a software application called a CAD browser. AutoCAD also has desktop and mobile app versions, which run directly on the computer that is used to create and view CAD drawings. What is it used for? AutoCAD is used for many things, including: Corporate design, including architectural and mechanical design Homes, including interior design and drapery Industrial design, including electronic and mechanical design Vehicle design, including vehicle bodies, paint and trim Architectural design, including building and construction design Design by manufactured objects, including furniture, appliances, and toys Other specialty uses of AutoCAD, such as by engineering, construction, and other technical fields, are noted in the sections below. 1. Architectural and architectural design 1.1. Architectural design AutoCAD is used in many ways by the architectural and building design community, including: Drafting, design, and production of three-dimensional (3D) models Designing and creating 2D drawings for various construction documentation Designing and creating 2D drawings for client presentations Integrating design and documentation Marking-up/coding plans and elevations Drafting and producing construction documentation Drafting and designing architectural lighting Drafting and designing landscaping and architectural elements Drafting and designing architectural perspectives Drafting and designing architecture Building 3D models and animations Building 3D models using accurate reference data Building 3D models using orthographic projections Using 3D modeling tools Using CAD viewers Drafting and designing architectural images (2D drawings) Drafting and designing buildings that are constructed on a mass-production basis Drafting and designing a building or building group in a

A total of 23 triterpene glycosides (1-23) and three saponins (24-26) have been isolated from the leaves of *Solanum nigrum* Linn. and evaluated for their inhibitory activity against LPS-induced nitric oxide (NO) production. The triterpene glycosides were found to inhibit NO production in a dose-dependent manner, while compound 5 was the most potent compound with IC(50) of 4.1 microM. The bioassay-guided fractionation of these glycosides has been performed, and compounds 1, 7 and 11-13 were found to be responsible for the suppression of NO production. The structure elucidation of glycosides 1, 7 and 11-13 was performed by one- and two-dimensional NMR spectroscopy. The results showed that compound 1 is a new derivative of ursolic acid, 7 is a new derivative of oleanolic acid and 11-13 is a new derivative of betulonic acid. The effect of compounds 1-3 on

LPS-induced expression of inducible nitric oxide synthase (iNOS) in RAW 264.7 macrophage cells was determined. All of the three compounds were found to inhibit the expression of iNOS at mRNA level, but not at protein level. These results suggest that compound 1 is the potential compound for the treatment of inflammatory diseases. a romantic relationship with another.
